Emerson Process Management

Industry: Manufacturing, Process Control & Automation

Challenge and Solution: Using Objectivity/DB on Windows NT, Emerson deployed a new generation of process control equipment for networked manufacturing environments. Its new generation of software includes a data archiving and retrieval system that allows manufacturing and other process control plants to track their systems and products over long periods of time. There is tons of information on the web site on this customer – they were originally called Fisher Rosemont and then purchased by Emerson Process Management and this is for a product called Delta V– I will include a separate ppt on the process control and automation industry where you can find a case study of Emerson's Delta V product.
